

Title: Allow users to create an account on the application

Description: As a user, he or she should be able to sign up for an account. After getting to the web page, the page should contain icons on the top right corner that asks the user to sign-in/create an account. When the user clicks this, a sign-in prompt will appear with entry fields for a username and password. If the user does not already have an account, there should be a “create an account” button underneath the “submit” button. This should trigger a new prompt for the user to enter the necessary information to create an account (username, password, and optional details such as current location, etc.). After the user has satisfied the account information requirements, he or she should click a button on the bottom that says “create new account”. If the user’s information passes requirements (password length, etc) the account will be created and the user will be returned to the sign-in prompt where he or she can log into the newly created account. If the user has entered account information that hasn’t satisfied the requirements, it should alert the user the reason and what he/she can do to fix it (too short of a password, etc.).
