

**Title:** Provide insight if user should go to beach or not (overall conditions)

**Description:** Once the user is in the app and is looking at the specific beach they're interested in going to, they will be able to see the beach's current conditions (Temperature, Water temperature, wind speed, wave height, clouds, humidity, pressure, etc.) This along with the reviews left by other users can help them determine whether they should go to the beach or not, depending on whatever they're trying to do there (whether it be surfing, tanning, etc.)
